

Overview

This analysis was performed using four months of rider and trip data to understand rider activity, cancellation patterns, wait times, and the performance of different rider segments. Before the analysis, the data was cleaned by handling missing values and removing duplicate records to improve the reliability of the results.

Top 3 Insights:

1. Rider activity increased steadily from July to October

The number of active riders grew each month, indicating increased platform usage during the analysis period. Monitoring this trend regularly can help identify future changes in rider retention.

2. Longer wait times were associated with higher cancellation rates.

Trips with longer waiting times were more likely to be cancelled. The cancellation rate increased noticeably once the average wait time exceeded around **8 minutes**, suggesting that wait time is an important factor influencing rider behavior.

3. The Regular rider segment recorded the highest cancellation rate.

Although the three rider segments had similar average ratings, fares, and trip distances, the **Regular** segment had the highest cancellation rate (**10.35%**). This indicates that this group is slightly more likely to cancel trips than Budget or Premium riders.

Rider Segment Requiring the Most Attention

The **Regular** rider segment requires the most attention because it has the highest cancellation rate among all rider segments. Since this segment also represents a large share of total trips, even a small reduction in cancellations could significantly improve overall rider retention and service quality.

Recommendations:

1. Reduce rider wait times by improving driver allocation and dispatch efficiency, especially during peak hours. Faster pickups are likely to reduce cancellations.

2. Monitor the Regular rider segment more closely to better understand why cancellations are higher in this group. Targeted promotions or service improvements may help improve retention.

1. **Continue tracking key performance metrics** such as active riders, average wait time, and cancellation rate on a monthly basis. Regular monitoring will help identify issues early and support better business decisions.
